

after enter sudo su
content looks white the exit
files greencolor,project blue color,normal txt files white
colors
how to set

What you're seeing is the **LS_COLORS** color scheme in Linux. Normally:

-  **Green** → Executable files (scripts, binaries)
-  **Blue** → Directories (folders/projects)
-  **White** → Regular text files
-  **Red** → Compressed files or broken links (depending on settings)
-  **Purple/Cyan** → Symbolic links or special files

If, after running:

```
</> Bash
```

```
sudo su
```

the terminal itself becomes white or the colors are not what you expect, try the following.

1. Check if color output is enabled

Run:

```
</> Bash
```

```
alias ls
```

You should see something like:

```
</> Bash
```

```
alias ls='ls --color=auto'
```

If it shows only:

```
</> Bash
```

```
alias ls='ls'
```

enable colors:

```
</> Bash
```

```
alias ls='ls --color=auto'
```

To make it permanent:

```
</> Bash
```

```
nano ~/.bashrc
```

Add:

```
</> Bash
```

```
alias ls='ls --color=auto'
```

Save and reload:

```
</> Bash
```

```
source ~/.bashrc
```

2. Check the LS_COLORS variable

Run:

```
</> Bash
```

```
echo $LS_COLORS
```

If nothing is displayed, initialize it:

```
</> Bash
```

```
eval "$(dircolors -b)"
```

To make it permanent, add this to ~/.bashrc :

</> Bash

```
eval "$(dircolors -b)"
```

Then run:

</> Bash

```
source ~/.bashrc
```

3. If using `sudo su`

Sometimes the root user has a different `.bashrc`.

Edit root's configuration:

</> Bash

```
sudo nano /root/.bashrc
```

Add:

</> Bash

```
alias ls='ls --color=auto'
eval "$(dircolors -b)"
```

Save and reload:

</> Bash

```
source /root/.bashrc
```

4. Verify terminal color support

Run:

</> Bash

```
echo $TERM
```

A common value is:

```
</> Bash
xterm-256color
```

If it says `dumb`, colors won't work correctly.

5. Test colors

Create some test files:

```
</> Bash
mkdir project
touch file.txt
touch script.sh
chmod +x script.sh
ls -l --color=auto
```

You should see:

- `project` →  Blue
- `script.sh` →  Green
- `file.txt` →  White

If your **entire prompt or terminal text turns white** after `sudo su`, tell me:

1. Which Linux distribution are you using? (Ubuntu, RHEL, CentOS, Amazon Linux, etc.)
2. Are you using **MobaXterm**, **PuTTY**, or the Linux terminal?
3. Share the output of:

```
</> Bash
echo $TERM
alias ls
echo $LS_COLORS
```
